

Verification

- OceanPredict to convince partners to use the common platform, for example EDITO, that provide easy access to models and observations for verification (cloud computing for example EDITO) in particular regional system for their verification
- OceanPredict could facilitate the interoperability of forecast verification
- OceanPredict IV-TT could help to build common/standard metrics for verification, tools (code) to the community, for example in github, provide also best practice, documentation on how to use the metrics
- OceanPredict IV-TT could promote the path to make verification to be operational, learning from WIP experiences
- OceanPredict could help for Promotion and Documentation, maybe a common platform such github to host all Task team materials
- OceanPredict could lead the effort to have python library
