*establishing a common understanding of a DTO*

An **accessible ocean** with open and equitable access to data, information, and technology and innovation.

Digital twins are fine-grained virtualizations of physical objects and systems which have been widely applied in the engineering realm for tasks such as engine optimization and port management.

As a concept, **digital twinning is gaining momentum in Earth and Ocean science**, particularly as a way to intuitively bundle and provide easy access to marine data, models, and simulations.

A well-constructed digital twin of the ocean will **enable a wider range of users to interact with digital assets to explore current and future scenarios**, especially related to human interactions with the ocean.

Develop a comprehensive digital representation of the ocean.

2021  
2030

United Nations Decade  
of Ocean Science  
for Sustainable Development

## Decade programme

- Global or regional in scale
- Fulfils one or more of the Decade objectives.
- Long-term (multi-year), interdisciplinary and typically multi-national.
- Includes component projects, and enabling activities.

Proposal for an OceanDecade Global Programme  
January 2021

## Digital Twins of the Ocean - DITTO

Lead-PI: Martin Visbeck, GEOMAR, Kiel, Germany

### Summary:

DITTO will establish and advance a **digital framework** on which all marine data, modelling and simulation along with HPC capacities, AI algorithms and specialized tools including relevant best practices will form a new globally shared capacity to access, manipulate, analyse and visualise marine information. It will enable users and partners to create ocean related development scenarios addressing issues such as green energy developments (renewable, non-renewable), mining impacts, fisheries and mariculture, marine protected area siteing, nature based solutions and ocean based tourism. Digital twins can quantify benefits and environmental change and provide powerful visualizations based on data and model derived knowledge. DITTO will enable scientists and professionals including scientific users to create their own local digital twins using standard workflows.

What would the global temperature look like if we put CO<sub>2</sub> in the atmosphere?

# Digital Twin ,Prototype‘

## Minimal Defense

Many communities have developed right along the ocean with only minimal natural defenses from a small strip of beach between them and the ocean.

## Natural

Natural habitats that can provide storm protection include salt marsh, oyster and coral reefs, mangroves, seagrasses, dunes, and barrier islands. A combination of natural habitats can be used to provide more protection, as seen in this figure. Communities could restore or create a barrier island, followed by oyster reefs and salt marsh. Temporary infrastructure (such as a removable sea wall) can protect natural infrastructure as it gets established.

## Managed Realignment

Natural infrastructure can be used to protect built infrastructure in order to help the built infrastructure have a longer lifetime and to provide more storm protection benefits. In managed realignment, communities are moving sea walls farther away from the ocean edge, closer to the community and allowing natural infrastructure to recruit between the ocean edge and the sea wall.

## Hybrid

In the hybrid approach, specific built infrastructure, such as removable sea walls or operable flood gates (as shown here) are installed simultaneously with restored or created natural infrastructure, such as salt marsh and oyster reefs. Other options include moving houses away from the water and raising them on stilts. The natural infrastructure provides key storm protection benefits for small to medium storms and then when a large storm is expected, the built infrastructure is used for additional protection.

What is the most cost effective option to mitigate the coastal impact of sea level rise?

*Program of the Ocean Decade*

An **accessible ocean** with open and equitable access to data, information, and technology and innovation.

## Opportunities for DITTO – FourSea&OceanPredict

- Fully embrace the opportunities of the ‘digital revolution’ and shape the future of the digital knowledge ecosystem to be collaborative, shared and equitable.
- Establish an Digital Ocean community building on the momentum of the Ocean Decade, the Ocean Mission, The Digital Twin Earth actions, the G7 agreement and global, regional and national initiatives.
- Work together in a ***Community Of Practice*** around ocean prediction (Decade Outcome).

Develop a comprehensive digital representation of the ocean.
